

Great Lakes Net Basin Supply Predictor

An advanced prediction tool that uses operational NOAA models to predict monthly mean values of **Net Basin Supply (NBS)** and its components - **precipitation, evaporation, and runoff** - for each of the Great Lakes. Designed for use by the U.S. Army Corps of Engineers.

The tool provides:

- ▶ Support for operational water level forecasting
- ▶ A framework for subseasonal to seasonal predictions
- ▶ Ensemble-based machine learning with uncertainty quantification
- ▶ Modular design allows for flexible experimentation with different methods

We are looking for contributors to test and improve our model. Learn more about how to get involved on GitHub.
